International Journal of Performability Engineering, Vol. 22, No. 08, August 2026**

| <b>Author(s)</b>                                                          | <b>Title of the Paper</b>                                                                                                                                        | <b>Pages</b> |
|---------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| Pushpendra Kumar Verma, Sandeep Gupta, and Tadiwa Elisha Nyamasvisva      | Adaptive Error-Mitigation Frameworks for NISQ-Era Post-Quantum Cryptographic Optimization                                                                        | 427-439      |
| Harnit Saini and Sanjeev Kumar Prasad                                     | Dependability-Aware Adaptive Federated Learning-Based Intrusion Detection for Evolving Cyberattacks in Heterogeneous IoT Networks                                | 440-449      |
| Mukul Yadav, Manju Khari, and Himanshu Nandanwar                          | A Hybrid Quantum-Classical Framework for Efficient Multiclass IoT Botnet Detection Using KPCA-VQC-XGBoost                                                        | 450-461      |
| Sathish Kumar                                                             | Computation-Aware Tiered Eviction: Optimizing KV Cache Management for Long-Context LLM Inference                                                                 | 462-472      |
| Rainu Nandal, Kiran Moar, Rashmi Sindhu, Vipin Kumar, and Kamaldeep Joshi | Energy-Efficient VM Placement and Replacement through a Hybrid MBFD Q-Learning Framework for Dynamic VM Consolidation                                            | 473-484      |
| Garima Singh                                                              | PerforNet: A Performability-Guided Attention-Contrastive Framework for Robust Fault Detection in Industrial Cyber-Physical Systems under Noisy Sensor Conditions | 485-494      |
